

RS485 bus switching actuator

Time relay for card switch or smoke alarm FZK12-12V DC

1-channel switching actuator, 1 NO contact not potential free 16A/250V AC, incandescent lamps up to 2000 watts. Off-delay and response lag are adjustable. Only 0.1 watt standby loss.

Modular device for DIN-EN 60715 TH35 rail mounting.

1 module = 18mm wide, 58mm deep.

Connection to the Eltako RS485 bus, terminals RSA and RSB.

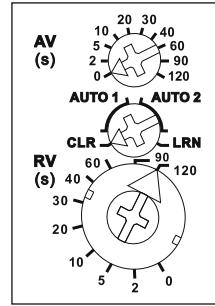

**Up to a total of 128 actuators can be added in this way.**

Up to 35 pushbuttons each with 4 functions can be assigned to each channel, of which one or more central pushbuttons.

Switching voltage 230V.

**Zero passage switching to protect contacts and consumers.**

#### Function rotary switches

Use the top rotary switch AV to set the response lag time AV between 0 and 120 seconds for Contact L-1.

The middle rotary switch is required for teach-in. Then define here the response after a power failure. In position AUTO1 the switch position is retained; in position AUTO2, the device is switched off according to a defined procedure.

Use the bottom rotary switch RV to set the time delay time RV between 0 and 120 seconds for Contact L-1.

The AV and RV times permit the simple control of lights and air conditioning systems with the wireless card switches FKF and FKC.

The response lag AV starts as soon as the hotel card/key card is inserted in the wireless card-operated door lock FKF and the time delay RV starts after the card is removed.

In addition to the wireless card switch FKF, wireless window/door contacts FTK, Hoppe window handles and motion/brightness sensor FBH can also be taught in.

Opening a monitored window also starts the RV time. When the RV time expires, Contact L-1 opens. Closing all monitored windows starts the AV time. When the AV time expires, Contact L-1 closes.

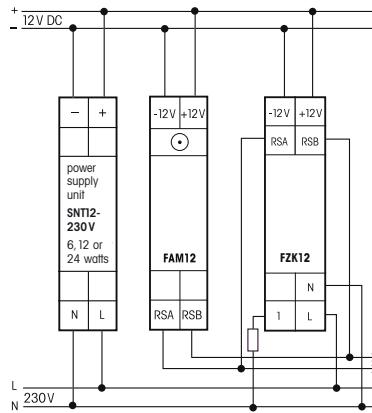

When motion/brightness sensors are used and the hotel card/key card is inserted, Contact L-1 closes immediately motion is detected. If no motion is detected for 15 minutes the contact opens, even if the hotel card/key card is inserted.

Several wireless smoke alarms FRW-ws are logically linked with this switch actuator time relay so that the RV time only starts after all FRW-ws devices have signalled alarm end.

**Card switches and smoke alarms can not be operated together with an FZK device.**

The LED under the upper rotary switch performs during the teach-in process. It shows control commands by short flickering during operation.

#### Typical connection

#### Teaching-in wireless sensors in wireless actuators

All sensors must be taught-in in the actuators so that they can detect and execute commands.

#### Teaching-in actuator FZK12

The teach-in memory is empty on delivery from the factory. If you are unsure whether the teach-in memory contains something or not, **you must first clear the memory contents completely:**

Set the middle rotary switch to CLR. The LED flashes at a high rate. Within the next 10 seconds, turn the upper rotary switch three times to the right stop (turn clockwise) and then turn back away from the stop. The LED stops flashing and goes out after 2 seconds. All taught-in sensors are cleared.

**Clear individual taught-in sensors** in the same way as in the teach-in procedure, except that you set the middle rotary switch to CLR instead of LRN, and operate the sensor. The LED previously flashing at a high rate goes out.

#### Teaching-in sensors

1. Set the middle rotary switch to LRN. The LED flashes at a low rate.
2. Operate the sensor to be taught-in. The LED goes out.

If more sensors require teach-in, turn the upper rotary switch briefly away from the LRN position and then back again.

**After teaching-in with the top rotary switch** set the response lag AV. Function dependent on sensor type:

#### Wireless card switch FKF:

After the hotel card/key card is inserted, the AV starts. At the end of the AV, the contact closes.

#### Wireless window/door contact FTK and/or Hoppe window handles:

After a window is closed, the AV starts. At the end of the AV, the contact closes.

#### Motion detector/brightness sensor FBH:

If "motion" is sent, the contact closes immediately.

**Use the middle rotary switch** to set the function AUTO1 or AUTO2:

**AUTO1:** The relay switch position remains unchanged in case of a power failure.

**AUTO2:** The relay switches off in a defined state after a power failure.

**Use the bottom rotary switch** to set the time delay RV. Function dependent on sensor type:

#### Wireless card switch FKF:

After the hotel card/key card is removed, the RV starts. At the end of the RV, the contact opens.

#### Wireless window/door contact FTK and/or Hoppe window handles:

After a window is opened, the RV starts. At the end of the RV, the contact opens.

#### Motion detector/brightness sensor FBH:

If "no motion" is sent, a fixed time delay of 15 minutes starts. At the end of the time delay, the contact opens.

When an actuator is ready for teach-in (the LED flashes at a low rate), the very next incoming signal is taught-in. Therefore, make absolutely sure that you do not activate any other sensors during the teach-in phase.

#### Important note!

**Only skilled electricians may install this electrical equipment otherwise there is the risk of fire or electric shock.**
